BAKESALE POS

Reports — Calculation Guide

How every number in every report is computed

1. Sale Report

Shows everything that happened in a selected date range — sales, returns, and direct sales — as a single net total.

How each total is calculated:

Total	Formula
Grand Total	Sum of all sale bills + Direct sales − Item returns
Cash Total	Pure cash bills + cash portion of split bills (Cash+Card or Cash+UPI) − cash returns
Card Total	Pure card bills + card portion of split bills − card returns
UPI Total	Pure UPI bills + UPI portion of split bills − UPI returns

Note: *Grand Total is always the net cash collected — returns are already deducted. The bill list shows every individual sale bill; direct sales and returns are shown as separate sections below it.*

2. Item-wise Sale Report

Shows how many units of each product were sold and the total revenue — after deducting customer returns.

Calculation steps:

1. 1. All sale bill line items (SaleItems) are grouped by Product and MRP.
2. 2. Quantities are summed for the selected date range.
3. 3. All customer returns (return type = Customer Return) in the same date range are fetched and matched by product and price.
4. 4. Returned quantity is subtracted from sold quantity.
5. 5. Products where net sold quantity = 0 are removed from the list.

```
Net Quantity  =  Quantity Sold  -  Quantity Returned

Total Amount  =  Net Quantity  ×  MRP
```

Note: *If a customer bought 10 kg of Sugar and returned 3 kg, the report shows 7 kg and revenue for 7 kg only. A "partial return deducted" indicator appears next to any product that had returns.*

3. Purchase Report

Shows all purchase bills from vendors in the selected date range — cost, tax, round-off, and grand total.

Calculation for each bill:

```
Bill Taxable   =  Σ (Quantity × Purchase Price)  for all items in the
bill

Bill Tax       =  Σ (Quantity × Purchase Price × Tax%)  for all items

Bill Total     =  Taxable  +  Tax  +  Round-off

Grand Total    =  Sum of all Bill Totals in the date range
```

Note: *This report shows what was purchased, not what was paid. Use the Paid / Not Paid column to track pending payments. Purchase returns are shown separately in the Purchase Returns tab and are not subtracted from this total.*

4. Purchase Returns Report

Shows items that were returned back to vendors, with quantity, price, reason, and status.

Status	Meaning
Pending	Return has been raised but the stock has not yet been sent back to the vendor.
Returned	Return confirmed — stock has been physically sent back to the vendor.

Note: *Only Returned (confirmed) purchase returns are deducted from the Purchase Tax Report. Pending returns have no effect on any tax calculation.*

5. Sales Tax Report (GST)

Shows the CGST + SGST breakdown per sale item for filing GST returns — net of customer returns.

Per-row calculation (each bill line item):

```
Total Amount    =  Quantity  ×  Selling Price  (tax-inclusive)

Taxable Amount  =  Total Amount  ÷  (1  +  Tax Rate / 100)

Total Tax       =  Total Amount  −  Taxable Amount

CGST            =  Total Tax  ÷  2

SGST            =  Total Tax  ÷  2
```

How customer returns are deducted from totals:

All items returned by customers in the same date range are fetched. The same tax formula is applied in reverse for each returned item, and the resulting taxable amount and tax are subtracted from the grand totals shown in the report summary and print.

Example:

Scenario	Amount
Sold ₹1,000 of goods at 5% GST	
Taxable (gross)	₹952.38
GST (gross)	₹47.62
Customer returned ₹200 worth	
Return taxable	₹190.48
Return GST	₹9.52
Net Taxable shown in report	₹761.90
Net GST shown in report	₹38.10

Note: *Use the Tax Rate filter dropdown to view each GST slab (5%, 12%, 18% etc.) separately. Individual bill rows still show the gross amounts — only the summary totals and printed report totals are net.*

6. Purchase Tax Report (GST)

Shows CGST + SGST on purchases for claiming Input Tax Credit — net of confirmed purchase returns.

Per-row calculation:

```
Taxable Amount  =  Quantity  ×  Purchase Price  (base, excluding tax)

Tax Amount      =  Taxable Amount  ×  Tax Rate / 100

CGST            =  Tax Amount  ÷  2

SGST            =  Tax Amount  ÷  2

Total Amount    =  Taxable  +  Tax
```

Case / Nos conversion:

If a product was purchased by the case but sold individually, the report automatically converts:

```
Quantity  =  Cases  ×  Units per Case

Price     =  Case Price  ÷  Units per Case
```

How purchase returns are deducted (FIFO method):

Only returns with status = Returned (confirmed) are included. Returns are applied product by product in the order they were received (oldest purchase first). If the return quantity is larger than one purchase line, it spills over to the next.

> **Note:** *If you bought 100 kg and returned 20 kg (confirmed), the taxable quantity shown is 80 kg. Pending returns have no effect on this report.*

7. Item Return Report

Shows all stock adjustments made through the returns module — customer returns, damaged stock, and expired stock.

Return Type	Effect on Stock	Cash Refund?
Customer Return	Quantity added back to the highest-MRP batch in inventory.	Yes — refunded via same payment mode (Cash / Card / UPI)

Damaged	Quantity moved from normal stock to Damaged stock. Deducted from highest-MRP batches first.	No
Expired	Quantity moved from normal stock to Expired stock. Deducted from lowest-MRP batches first (oldest out first).	No

Note: *The Grand Total in this report = sum of Customer Return amounts only. Damaged and Expired entries are internal stock adjustments with no monetary value.*

8. Internal Sale Report

Shows stock transferred from the main store to other locations (e.g., a branch counter or department).

```
Line Total   =  Quantity  ×  Transfer Price

Grand Total  =  Sum of all Line Totals in the date range
```

Note: *Internal sales reduce stock from the main inventory at the time of transfer. They are not included in the main Sale Report grand total.*

9. Direct Sale Report

Shows sales of fixed-price items that do not have a product barcode (e.g., service charges, packaging fees, or any item from the Direct Sale Master list).

```
Grand Total  =  Sum of all Direct Sale amounts in the date range
```

Note: *Direct sale amounts are included in the main Sale Report grand total. The Direct Sale Report tab shows only the detail breakdown.*

Quick Reference — What each Grand Total means

Report	Grand Total =
Sale Report	Net cash collected (sales + direct sales − item returns)

Item-wise Sale	Net revenue per product after customer returns
Purchase Report	Total cost of goods purchased (gross, no return deduction)
Purchase Returns	Total value of goods sent back to vendors
Sales Tax Report	Net taxable amount and GST owed after customer returns
Purchase Tax Report	Net input tax credit after confirmed purchase returns
Item Return Report	Total cash refunded to customers (customer returns only)
Internal Sale Report	Total value of stock transferred to other locations
Direct Sale Report	Total collected from fixed-price / service items
